

# Oil is Dead

Cincinnati, OH. – 50 years ago today, at a global sustainability summit, scientists revealed the result of decades of research – a sustainable source of energy to power the future. Today, the full impact of this discovery can be felt. In 10 years, energy costs have fallen to such a degree that everything from electric cars to electric planes have become economic ways of travel. In addition, due to the versatility of the scientists' discovery, clean energy courses through 98% of the planet. The world itself is healthier, too, because atmospheric levels of CO<sub>2</sub> are falling rapidly due to their inherent use in the new energy process. Normal CO<sub>2</sub> levels are expected to return within ten years. Also, landfill size is decreasing because of the use of waste in the energy generation process.

See DEAD, A5.
